Script File

1. Following the model in Lesson 4, produce an M-file script for plotting an ellipse. The script should prompt for the semimajor and semiminor axes (hint: use the input function).

2. Be sure to include appropriate comments, help text, and keywords.

3. Turn in a hard copy of you M-file, the command line help text output for your script, a command line demonstration of using the lookfor keyword search that finds your script file, and a print out of a Word document featuring your graphical output.
